

the hard part: **choosing the model**

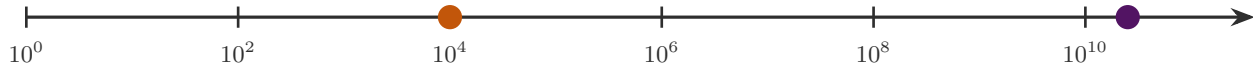

$\sim 10^4$ spectral parameters
one per sky patch

component separation

the hard part: **the forward model**

$3072^3 \simeq 3 \times 10^{10}$ voxels
of the initial field

field-level inference

number of unknowns inferred

←-----→
same inverse problem, $\mathbf{d} = \mathcal{A}(\mathbf{s}, \boldsymbol{\theta}) + \mathbf{n}$
